                                                                   transduces the apoptotic signal into cells, May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNFRSF6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DCR3 modulates its effects (By similarity).

May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNFRSF6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DcR3 modulates the affect.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         transduces the apoptotic signal into cells. May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNFRSP6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DCR3 modulates its effects (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein and secreted (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             KIDNEY AND LUNG.

INDUCTION: BY PMA/IONOMYCIN AND CONCAVALIN/INTERLEUKIN-2.

PYM: The soluble form derives from the membrane form by proteolytic processing (By similarity).

SIMILARITY: BELONGS TO THE TUMOR NECROSIS FACTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         similarity).

May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNFRSF6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DcR3 modulates its effects (By similarity).
-i- SUBUNIT: HOMOTRIMER (PROBABLE).
-i- SUBCELLULAR LOCATION: Type II membrane protein (isoform FASL);
Secreted (isoforms FASL and FASLS).
Secreted (isoforms FASL and FASLS).
-i- ALTERNATIVE PRODUCTS: 2 ISOFORMS; FASL (SHOWN HERE) AND FASLS; ARE PRODUCED BY ALTERNATIVE SPLICING. ISOFORM FASL MEDIATES APOPTOSIS
WHILE ISOFORM FASLS PREVENTS APOPTOSIS INDUCED BY FAS/FASL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. FUNCTION: Cytokine that binds to TNFRSF6/FAS, a receptor that transduces the apoptosit signal into cells. May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNFRSF6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DcR3 modulates its effects (By similarity).

SUBQUIT: Homotrimer (Probable).

SUBQUITAR LOCATION: Type II membrane protein and secreted (By SUBCELLIJLAR LOCATION: Type II membrane protein.

11- FUNCTION: IE-N AUTOREGULATES ITS OWN EXPRESSION AND STIMULATES BOTH IE-1 AND IE-0 IN TRANSIENT ASSAYS. THE STIMULATION OF IE-: EXPRESSION MAY ACCOUNT FOR THE AUGMENTING ACTIVITY OF IE-N IN IE-1 MEDIATED TRANS-ACTIVATION OF THE 39K PROMOTER.

11- SIMILARITY: TO OPMUND IMMEDIATE-EARLY PROTEIN IE-2.

-1- SIMILARITY: CONTAINS 1 RING-TYPE ZINC FINGER.

                           Sequence
                                          Fas ligands or active fragments able to induce apoptosis in which express the Fas cell surface antigen are claimed. The proteins are isolated from human, rat and mouse sources. The sequence represents part of the human Fas ligand.

Antigens derived from the present human Fas ligand sequence can be used in the preparation of a neutral antibody against an apoptosis inducing Fas ligand. The antibody can be used in a Fas ligand assay, e.g. an enzyme linked immunosorbant assay, to diagnose diseases in which the Fas ligand/Fas antigen system is implicated, e.g. hepatitis B/C, human immunodeficiency virus, graft/host disorders, ulcerative colitis or sequelae of myocardinfarction. The antibody may also be used to treat such diseases
                                                                                                                                                                                                                                                       Antibody reactive with Fas ligand capable of inducing apoptosis used for diagnostic assay of Fas ligand in body fluids and for treatment of diseases in which Fas ligand/Fas antigen is involved
                                                                                                                                                                                                            Disclosure; Fig 1; 164pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence comprises the C-terminal extracellular domain of the Fas ligand altered to drive trimerisation with wild-type lymphotoxin (LT)-beta. LT subunit association domains potentiate subunit associations into an active trimeric ligand. Tunnour necrosis factor (TNF)-related ligand monomers mutated in their respective subunit associations domains can form heteromeric complexes with LT subunits. LT-alpha/beta heteromeric complexes and LT heterotrimeric complexes are useful as inhibitors of signalling by TNF receptors (R) and TNF-related receptors, such as CD40, FAS and LT-beta receptors. By inhibiting TNF-R signalling the complexes (esp., LT-alpha2/beta1) can be used for treating autoimmune diseases including diabetes, rheumatoid arthitits, inflammatory bowel disease and HIV proliferation, known to be improved by TNF inhibition. The complexes are also useful for preventing or reducing the severity of an immune
                                                                                                                                                                                                                                            /note= ".

LT subunit association domains potentiate subunit associations to an active trimeric ligand. Tumour necrosis factor (TNF) related ligand monomers mutated in their respective subunits. LT-alpha/beta heteromeric complexes with LT subunits. LT-alpha/beta heteromeric complexes and LT heterotrimeric complexes are useful as inhibitors of signalling by TNF receptors (R) and TNF-related receptors, such as CD40, FAS and LT-beta receptors. By inhibiting TNF-R signalling the complexes (esp., LT-alpha/beta). Can be used for treating autoimmune diseases including diabetes, rheumatoid arthritis, inflammatory bowel disease and HIV proliferation, known to be improved by TNF inhibition. The complexes are also useful for preventing or reducing the severity of an immune response to a tissue graft.
                                                           30-DEC-1999;

CC bound signalling molecules or receptors or is an antibody (or its Cf fragment). The invention also describes (a) FP containing as component B CC a protein of the Ciq or collectin families; (b) DNA sequences (II) that CC cells containing the vector of (c); and (e) (II) in which component B of CC proteins. The products of the invention have antiinflammatory, antiprotozoal, antivinon have antiinflammatory antiprotozoal, antivimor and endocrinological activity. (I) CC are useful, in human or veterinary medicine, to: (i) produce pharmaceuticals for treatment of inflammation; autoimmune diseases; CC hyper- or hypo-apoptotic states; infections (particularly of the lymphatic system) and/or endocrinological disorders; (ii) produce vaccines for active or passive immunization against CC infections (specifically rubella, measles, poliowyselfitis, rables, CC virus or influenza), also as vaccine adjuvants; or (iii) for in vitro CC diagnosis. Crosslinking of component A is now achieved without requiring CC activity and regeneration of activity. This sequence represents the Fasi CC trimer construct described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel dimers or oligomers (1) of dl., tri. tetra or penta-mers (II) of recombinant fusion proteins (FP) comprising at least one each of components A and B, where A is a biologically active protein (or fragment) and B is a protein (or fragment) that causes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel dimers or oligomers (I) of di-, tri-, tetra- or penta-mers (II) of recombinant fusion proteins (FP) comprising at least one each of components A and B, where A is a biologically active protein (or fragment) and B is a protein (or fragment) that causes dimerization/oligomerization of (I) without requiring a third molecule. Particularly A functions as a ligand for antibodies, soluble or membrane bound signalling molecules or receptors or is an antibody (or its fragment). The invention also describes (a) FP containing as component B a protein of the Clq or collectin families; (b) DNA sequences (II) that encode the FP of (a); (c) expression vectors containing (III); (d) host cells containing the vector of (c); and (e) (II) in which component B of FP is derived from the immunoglobulin, Clq or collectin families of proteins. The products of the invention have antiinflammatory, impurposed in the containing that is anticontaining the containing the vector of (c); and (e) (II) in which component B of the invention have antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunomodulatory, antiapoptotic, apoptotic, antiviral, antibacterial, antimatory, antiapoptotic, apoptotic, antiviral, antibacterial, antimatarial, antiprotozoal, antitumor and endocrinological activity. (I) are useful, in human or veterinary medicine, to: (i) produce pharmaceuticals for treatment of inflammation; autoimmune diseases; hyper- or hypo-apoptotic states; infections (particularly viral); tumors (particularly of the lymphatic system) and/or endocrinological disorders; (ii) produce vaccines for active or passive immunization against infections (specifically rubella, measles, poliomyelitis, rabies, tetanus, diphtheria, BCG, malaria, yellow fever, human immune deficiency virus or influenza), also as vaccine adjuvants; or (iii) for in vitro diagnosis. Crosslinking of component A is now achieved without requiring a third molecule (e.g. antibody), resulting in increased biological activity and regeneration of activity. This sequence represents the super-Fast construct described in the method of the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New dimers or oligomers of oligomeric recombinant useful as pharmaceuticals and vaccines, comprises and component that induces oligomerization -
                                                                  Human; Fas ligand; Fas ligand-fusion protein; leucine zipper; transmembrane protein; hepatotropic; immunosuppressive; apopt liver cell necrosis; viral hepatitis; autoimmune disease.
                                                                                                                                                                                                          FLAG peptide-Leucine zipper-human Fas ligand fusion protein.
                                                                                                                                                                                                                                                                                    20-MAR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           super-FasL construct described in the method of the invention

The fusion protein has hepatotropic and immunosuppressive activities. Binding of the Fas ligand sequence to Fas on the surface of cells expressing Fas induces apoptosis in the cells. The fusion protein can be used in the treatment of diseases with which Fas expressing cells are associated, such as liver cell necrosis produced by viral hepatitis, and autoimmune diseases. The present sequence represents a fusion protein of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence is Fas ligand (FasL) mutant delta 3. This protein was made by deleting amino acids 126-145 (inclusive) of the wild-type FasL sequence AAY28594. The FasL protein activates the Fas receptor which induces apoptosis. The FasL deletion mutants (AAY28595-Y28597) are non-cleavable. The mutations inhibit the proteolytic cleavage of FasL and have the capacity to activate a Fas receptor-mediated pathway.

Claimed mutants of FasL or an organ or tissue expressing a mutant can be used to alleviate symptoms of a fas receptor-mediated pathway, such as the conseptoriate stimulation of a Fas receptor-mediated pathway, such as a poptosis, in a tissue or organ. In particular, FasL mutants protect to treat intolerance to a graft in a patient. The FasL mutants protect can organ or tissue from autoimmune destruction.

CC Note: The present sequence is not shown in the specification but it has been derived from the wild-type FasL sequence AAY28594 shown in the
